A suction catheter assembly comprising a suction catheter and a valve for controlling flow along said suction catheter, said valve comprising: a housing defining a first bore in communication with said suction catheter and a second bore extending to an outlet opening into said first bore through an aperture; a valve member, said valve member having a sealing surface and being slidable in alignment with said first bore from a first position where said sealing surface is on a side of said aperture remote from said first bore such as to allow unobstructed fluid flow from said suction catheter along the first bore to the second bore to a second position on an opposite side of said aperture to block flow of fluid from said suction catheter between said first and second bores, wherein said valve includes a rotatable locking member operable to prevent movement of said valve member, wherein said locking member is mounted on said

housing and has an external surface formation, ~~and wherein~~ that is out of alignment with a part of said valve member when said locking member is rotatable between a first position ~~in which said surface formation is out of alignment with a part of said valve member and said valve member~~ where said valve member is free for sliding movement, to a second position where said external surface formation is in alignment with said part of said valve member so as to hinder movement of said valve member.
